

III Semester M.Sc. Degree Examination, December 2016  
(2010-11 Scheme) (NS) (Repeaters)  
CHEMISTRY  
C 302 – PC : Photochemistry

Time : 3 Hours

Max. Marks : 80

**Instruction :** Answer question no. 1 and **any five** of the **remaining**.

1. Answer **any ten** of the following : **(2×10=20)**
- State the Grotthus-Draper and Stark-Einstein laws.
  - Calculate the energy associated in Kilojoules for a photon of wavelength 365 nm.
  - What is meant by 'inverted multiplet' ? Explain it on the basis of Hund's rules.
  - Give the electronic configuration of oxygen molecule.
  - Define the terms photodissociation, predissociation and induced predissociation.
  - Give the direct product rule for assigning molecular symmetry from orbital symmetry.
  - Give the molecular orbitals and their approximate energy levels and types of transitions in formaldehyde molecule.
  - State the Wigner's spin conservation rule.
  - Write a note on solar energy conversion and storage.
  - What are time resolved experiments ?
  - Write a note on two photon absorption spectroscopy.
  - Give any method of finding the light intensity.
2. a) Derive the term symbols for the two p electrons of a oxygen atom and draw the energy level diagram.
- b) Justify the statement that  $\text{Eu}^{3+}$  and  $\text{Tb}^{3+}$  are inverted multiplets. **(8+4=12)**
3. a) Give the pictorial description of bonding and antibonding molecular orbital formation from atomic orbitals for  $\sigma$  and  $\pi$  bonds.
- b) Draw the relative molecular orbital energies of an octahedral complex. **(6+6=12)**

4. a) Draw the potential energy diagram for molecular oxygen giving the electronic energy states along with absorption spectrum using term symbols of the molecule.
- b) Which reaction parameters can be obtained from the Stern-Volmer plot ?  
(8+4=12)
5. a) Give the photophysical pathways for the following process in the Jablonski diagram.
- i)  $A'^* \rightarrow A^* + \text{heat}$
  - ii)  $A^* \rightarrow A + \text{heat}$
  - iii)  $A^* \rightarrow A + h\nu_f$
  - iv)  $A^* \rightarrow {}^3A^* + \text{heat}$
  - v)  ${}^3A^* \rightarrow A + h\nu_p$
  - vi)  ${}^3A^* \rightarrow A + \text{heat}$ .
- b) Justify the statement 'organic fluorescence usually originates from lowest excited singlet level'.  
(8+4=12)
6. a) Describe the two different methods of finding the excited state acidity constant.
- b) How do you obtain the shapes of the absorption bands based on the Franck Condon principle ?  
(6+6=12)
7. a) Compare the thermal and photochemical reaction pathways for electrocyclic reaction.
- b) Give the Einstein's treatment of absorption and emission.  
(8+4=12)
-
